

## Records Management

**Documents, manuscripts, primary research, contracts, invoices and other sensitive data.**

Archives and libraries, where documents, manuscripts, research and books are stored are areas that need to be well protected against fire. The high fire load of these objects requires application of a particularly multifaceted fire safety system. In addition to ensuring human safety, fire safety must be a priority in order to preserve irreplaceable items for either commercial use or to preserve our cultural heritage. Our mission is to protect these assets from fire.

Many fire suppression systems can cause collateral damage or even destroy the very assets that they are expected to protect. Consultants and fire specialists require a fire suppression system that assures the safety of the protected space from fire without triggering unforgiving collateral damages. FirePro fire suppression systems with their characteristics have repeatedly proven to be the best-in-class choice to match these tough prerequisites.

Efficiency levels are reached in seconds by the FirePro systems extinguishing remarkably rapidly fires from electrical and flammable liquid sources preventing major destruction. Speed and efficiency reduces structural and equipment damage, minimal data loss and restricts risk of injury to people working in the vicinity of fire. FirePro compounds are electrically non-conductive, non-corrosive and non-toxic and what is more they are both friendly to humans and the

environment.
